SanerNow Vulnerability Management

SanerNow – Your 'OS' for managing and securing endpoints

Today's Reality

- **90% of exploits occur because of unpatched endpoints**

- **Valuable resources are wasted on ineffective vulnerability management**

- **An average of 22 new vulnerabilities are discovered each day**

The Challenge

Vulnerability management products are highly complex to use, consume a lot of network bandwidth, and hog system resources. They do not always fix the problem. This makes organizations reluctant to run daily vulnerability scans. Instead, scans are run weekly, monthly or quarterly. And even after a scan, tools aren't available to easily fix vulnerabilities.

Scans often generate thousands of pages of reports but ignore patching, a key component of vulnerability management. Without patching, endpoints remain vulnerable to exploits for 30-90 days while patches are applied. That's far too long.

The Solution

SanerNow Vulnerability Management (VM) is a cloud-delivered service that performs an automated daily vulnerability scan. Organizations can discover their threat and vulnerability risk in less than five minutes. SanerNow VM provides continuous visibility into IT systems. Its time-tested SCAP Feed database delivers comprehensive vulnerability coverage.

Key Benefits

- ☑ **Mitigates risk** – Automates vulnerability identification and prioritizes remediation based on risk to business operations.

- ☑ **Streamlines audits** – Scans from a single interface and delivers continuous risk assessment without impacting system resources.

- ☑ **Ensures compliance** – Detects non-compliant system configurations and supports regulatory standards and organization security policies.

- ☑ **Saves money** – Reduces capital expenditures, maintenance, and infrastructure with on-demand SaaS technology.

SanerNow Vulnerability Management

Key Features & Capabilities

☑ Runs continuous vulnerability scans throughout the network, in the background, at a scheduled time daily

☑ Flags vulnerabilities, attacks, and malware by asset for a complete risk analysis

☑ Provides indicators of compromise by combining data from endpoint monitoring with intelligence gathered from the server, and generates email alerts to draw attention to potential attacks or attacks in progress

☑ Continuously monitors endpoints to manage security and provide device details by OS, ports, services and certificates

☑ Uses the largest database of vulnerability checks, identifies required patches, patch aging and steps to mitigate vulnerabilities

☑ Provides a comprehensive, detailed executive report with an ability to send email alerts to highlight security risks
